2. Please consider each class in a seperate .java file with appropriate imports and namespace definitions.

```
class Order {
    private Double basePrice;
    private OrderLine[] lineItems;
    private Customer customer;

    public void calculatePrice() {
        lineItems[0].getQuantity(); /*It is not clear from the DSD whether there should be a loop here or not. Also, the DSD has no returning message for these methods */
        Product product = lineItems[0].getProduct();
        Double pricingInfo = product.getPricingDetails();
        calculateBasePrice(); // Again, not clear what the method does with this info because there is no loop.
        calculateDiscounts();
    }
    private void calculateBasePrice() {...}
    private void calculateDiscounts() {
        Double discountInfo = customer.getDiscountInfo();
    }
}
class OrderLine {
    private Integer quantity;
    private Product product;
    public Integer getQuantity() {...}
    public Product getProduct() {...}
}
class Product {
    private Double pricingDetail;
    public Double getPricingDetails() {...}
}
class Customer {
    private Double discountInfo;
    public Double getDiscountInfo() {...}
}
```

3. Group number 6.

- Implemented the JsonParser class which was used to convert our Java objects to and from the JSON format. I also helped Emre Aydemir with implementation of the main method, as we were pair-programming, as did he.
- Helped create the DCD/DSD together with all group members.
- Tested git repo size changes when including PDF files in version tracking.
- Helped create the RAD together with Melik Gagan Odincioglu
- Also some minor bug-fixes, readability changes etc.
- Also added lots of annotations and extra methods to almost all classes to match the JSON output given as a sample.
